Setting big things into motion.

Ergonomics meets Control Technology
Rotatable KST 19 Control Unit

The rotatable KST 19 control unit was ergonomically designed and meets the highest requirements for comfort.

Control panels
The KST 19 control unit features multi-functional control panels which can be moved sideways, turned and tilted by two handles on the underside of the panels. The panels can also be customized with individual operating devices. For this, Gessmann offers a large range of compatible joystick models as well as buttons, switches, control dials, control lamps and displays.

User Interface
The touchscreen that is integrated into the KST 19 control unit allows you to ergonomically control secondary processes and to carry out monitoring functions. Through the movable monitor arm and tiltable monitor case, the user interface can be perfectly adjusted.

Seat
The comfortable driver seat, featuring a pneumatic vibration absorption system and weight adjustment, offers a large range of adjustment options. With its air permeable cover, made of either artificial leather or textile material, the seat provides optimal comfort even during longer use.
Unlimited/limitless use

At work, a good posture will significantly contribute to your well-being and to maintaining your work performance. With our KST 19 control unit, we can offer you the latest technology including the precision that is necessary for cranes and lifting equipment. We will also be happy to provide you with solutions that are customized to meet your demands.

"From use in tower cranes…

…to ship-to-shore solutions…

…to control rooms for gantry cranes serving hopper/bunker systems.“

Whether it is used for a crane or a hopper/bunker system – with its special design, the KST 19 control unit can be used for the most different/many different applications while at the same time it ensures safe processes and optimal comfort.
Scientifically proven

Under ergonomic as well as medical aspects, it is recommended that one changes the body’s position regularly. Our KST 19 control unit, with its multi-functional adjustable control panels, offers the unique option to switch between a sitting or standing position while working. This minimizes the risk of musculoskeletal disorders resulting from one-sided strains that typically occur with this type of work.

In the course of a scientific study conducted by the Chair of Ergonomics of the Technical University of Dresden, in cooperation with the GWT-TUD GmbH, the KST 19 control unit was tested and assessed under ergonomic aspects. For this, typical use scenarios and activities were examined, taking into consideration the latest findings. Optimal adjustability of the control unit with respect to many different user collectives was assessed according to anthropometric standards, usability and comfort experience.

**Anthropometry**
- Anthropometric validation by testing different percentile values for women and men
- Examination based on body dimensions in accordance with DIN 33402-2:2005

**Posture analysis**
- Assessment of posture during seated or standing operation by means of OWAS
- RULA-analysis of the left and right hand-arm system
Usability and comfort

Different postures while sitting or standing in specific scenarios (unobstructed view, looking down, looking up) were tested using a selected subject group consisting of women and men of all ages and percentiles. In addition, other subjective factors with respect to usability, adjustability and comfort were recorded.

The results were compared to the requirements of national and international standards. The posture and ergonomics values were compared to the data from the ISO 11226 and DIN EN 1005-4 standards.

Usability

Comprehensive usability tests as well as comfort studies carried out for the KST 19 control unit in the course of the study confirmed the results of the software-based assessments.
Pressure distribution measurements
To assess the seat comfort, an analysis of the measured pressure values was carried out in addition to the subjective evaluation through the subject interviews. This method is also used in the automotive industry to optimize vehicle seat designs. The surface pressures on the seat and the backrest were determined by means of sitting tests in different working positions.

Seat Comfort
For the best seat comfort, maximum pressure values in the range from 2 to 7 kPa are recommended for the area of the upper and lower back as well as the area of the upper thigh. These values could be scientifically proven for short-term as well as long-term use during the tests conducted on the KST 19 control unit.

Ergonomics meets Control Technology
With the correct adjustment of the seat and the control panels, the shoulder and neck muscles will not be stressed any more than when doing normal work on a personal computer. If the operator also switches between seated and standing operating positions on the control unit there will be an additional positive effect.

Surface electromyography
By means of SEMG measurements, the strain on the muscles of the shoulder and neck areas as well as in the area of the lumbar spine were determined in different working positions. The results show that especially in the area of the lumbar spine the strain/exertion on the muscles can be significantly reduced as compared to conventional seats without adjustable control panels.

1) musculus erector spinae  3) musculus deltoideus
2) musculus trapezius     4) musculus splenius capitis
The swiveling KST 19 control unit

**Adjustment options**
- Swiveling control unit (complete unit)
- Horizontal adjustment of seat with control panel
- Height/vertical adjustment of seat including control panels
- Adjustment of backrest
- Horizontal adjustment of seat
- Left/right control panel adjustable
- Horizontal adjustment of control panels
- Height/vertical adjustment of control panels in relation to seat
- Tilt adjustment of control panels
- Hinged monitor holder

**Data base**

The procedures and testing methods used in the ergonomic assessment* are based on the latest findings and codes and standards or implement such. The test results reflect the state-of-the-art.

**Anthropometry and posture analysis**

**Usability and product design**

*The ergonomic assessment was done in the course of the study titled „Expert opinion on the KST 19 control unit“ carried out by the Technical University of Dresden in cooperation with the GWT-TUD GmbH.
